

## Green Products

**TimberSIL®**

Non-toxic, non-corrosive TimberSIL® uses the fusion of glass to wood as a barrier to resist common wood problems. The glass also increases wood's strength and fire resistance. It comes ready for paint or stain. 703.644.0991. [www.timbersilwood.com](http://www.timbersilwood.com).

### Wood Protection

Glass particles are barriers to rot and insects without harming the environment.

TimberSIL® uses glass to resist rot, moisture, and termites.

Non-toxic, non-corrosive TimberSIL® contains glassy layers that have been fused into the cellular structure of the wood. The glass takes up space water would have penetrated, so the wood resists moisture, says Rick Dixon, vice president of business development sales and marketing for TimberSIL® Products, the manufacturer. The glass also keeps termites from seeing wood as a food source, gives wood more strength, prevents wood from warping, and makes it more flame retardant.

“The long story short is we've taken readily available softwood and made it act like hardwood,” Dixon says.

TimberSil can be installed indoors, outdoors, in ground, and above ground. Dixon says popular applications have been shingles, decking, flooring, and exterior flooring.
